CDI Standard

CDI (Computer Graphics Interface) is an OSI proposal to standardize the interface for graphic external software. It provides a general standard for graphic communication and can be used for a wide range of applications. CDI would be a useful tool for developers of graphic software to make their software more portable and easier to use.

A new CDI implementation

We have developed a special GKS implementation of CDI as part of our GKS system. The new CDI implementation is a major step forward in standardizing graphic communication and can be used for a wide range of applications. CDI will be available for PCs in January 1988. GKS-CDI will be released in March 1988.

The CDI implementation for the Motorola systems and PCs, and the GKS for PCs was written by Herman Krieger.
